Five checks before an assistant touches a second account

A useful boundary beats a confident assumption.

Sign in privately. Authorise in a private window with only the target account signed in.

A useful boundary beats a confident assumption.

Name it after the place. Label each connection by community or project, not by provider.

A useful boundary beats a confident assumption.

Never trust the default. Say which account on every request.

A useful boundary beats a confident assumption.

Test it. Ask a question only that account can answer before you trust the rest.

A useful boundary beats a confident assumption.

Know the off switch. Revoke each connection in one step.

A useful boundary beats a confident assumption.

Connect once. Keep the boundaries. Ask across everything.

A useful boundary beats a confident assumption.
